## Ansible works best if the passwordless access is configured on all nodes:
$ ssh-keygen
$ ssh-copy-id lmaly@<HOST>
$ ssh lmaly@<HOST>

## Configuration, Inventory default(s):
$ cat /etc/ansible/hosts
$ grep host_file ansible.cfg
  Priority in which the config files are processed:
    1) ANSIBLE_CONFIG (an environment variable)
    2) ./ansible.cfg (in the current directory)
    3) ~/.ansible.cfg
    4) /etc/ansible/ansible.cfg
  $ ansible --version     <-shows what config file is currently being used

Commonly Modified Settings in 'ansible.cfg':
inventory= Location of Ansible inventory file
remote_user= Remote user account used to establish connections to managed hosts
become= Enables/disables privilege escalation for operations on managed hosts (NOT
BY DEFAULT!)
become_method= Defines privilege escalation method
become_user= User account for escalating privileges
become_ask_pass= Defines whether privilege escalation prompts for password

# Default module (command, NOT SHELL!) is defined in 'ansible.cfg' under 'defaults'
section:
$ grep module_name /etc/ansible/ansible.cfg
  !If no modules defined, predefined command module used

################################################################################
## Run the playbook(s):
  $ ansible -i localhost, <playbook>.yaml
    !When using the '-i' parameter, if the value is a 'list' (it contains at least
one comma) it will be used as the inventory LIST
    !It can be either FQDN or IP address
  $ ansible -i /etc/ansible/hosts <playbook>.yaml
    !While the variable is a string, it will be used as the inventory PATH

## Ansible verbosity:
$ ansible-playbook -v -i <HOST> <playbook>.yaml      <-displays output data
$ ansible-playbook -vv -i <HOST> <playbook>.yaml     <-displays output & input data
$ ansible-playbook -vvv -i <HOST> <playbook>.yaml    <-information about
connections
$ ansible-playbook -vvvv -i <HOST> <playbook>.yaml   <-information about plugins

################################################################################
## Inventory file examples:
    [webserver]          <-both hosts can be reduced to ws[01:02].lmaly.io using
regexp
    ws01.lmaly.io
    ws02.lmaly.io:1234   <-configured to listen on port 1234

    [database]
